

A new website for Erić Dental Centar

From WordPress to a fast, static site built for local search, online booking and three languages.

CLIENT

Erić Dental Centar, Pančevo, Serbia

ROLE

Design, development, SEO, lead tracking

DOMAIN

zubarpancevo.com

STACK

Astro, Tailwind CSS, static HTML

60

pages

3

languages

9

services

0

lost URLs

Summary

The old site was a WordPress theme with demo content that had never been removed: the theme's sample doctors, an empty "Announcements" section and pages that had nothing to do with the practice. There was no clear path from a search to a booked appointment.

The new site was built from scratch with one goal: a patient in Pančevo or Belgrade looking for a dentist finds Erić Dental Centar, understands what the practice does and sends an appointment request in under a minute. Every request lands in a lead-tracking system and gets counted.

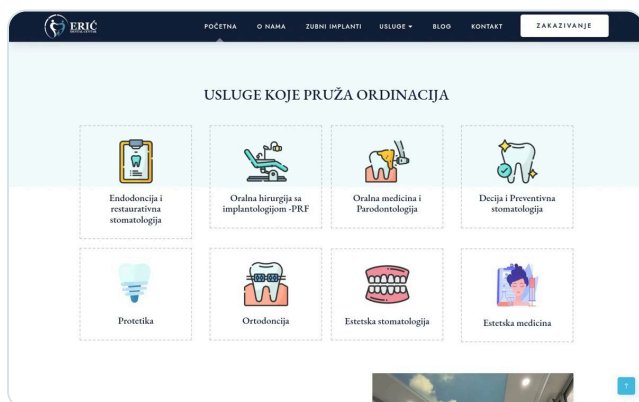

Before and after

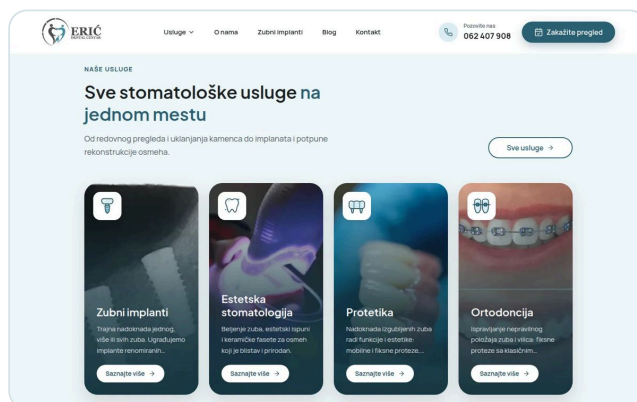

Before: WordPress theme

After: the new site

Before: WordPress theme

After: the new site

Technology and speed

- The site is built with Astro and ships as plain HTML. No framework loads in the browser, so pages open instantly, even on a weak mobile connection.
- Fonts are self-hosted, with full support for Serbian characters. Images are resized and converted to modern formats at build time, in several sizes for different screens.
- The Google map loads only when a visitor clicks it. Until then there are no requests to Google and no cookies, which keeps the page fast and private.

Design that sells the service

- A large hero with a photo of Dr Miloš Erić, the 5.0 rating from 31 patient reviews on doktor.rs and a clear call to book.
- Custom icons for all 9 services instead of icons taken from other sites, and the logos of the implant brands the practice uses: Straumann, Zimmer and IRES.
- Sections for the practice, the team (Dr Miloš Erić and Marina Erić), patient reviews and the blog, all in the practice's colours.
- On phones, "Call" and "Book an appointment" buttons stay within thumb's reach.

Booking and lead tracking

- The contact page works as a landing page: the form is on the first screen, only name and phone are required, and the service and preferred time are picked with a single tap.
- From every service page the form opens with that service already selected, and every page ends with a call to book that leads to the form.
- Every request goes into my lead system: the practice is notified immediately, and each request shows the page the patient came from, the service they want and the language they wrote in.
- Visits and clicks on the phone number and email are counted too, without cookies. All of it goes into a monthly report, so the practice sees what the site actually brings in.

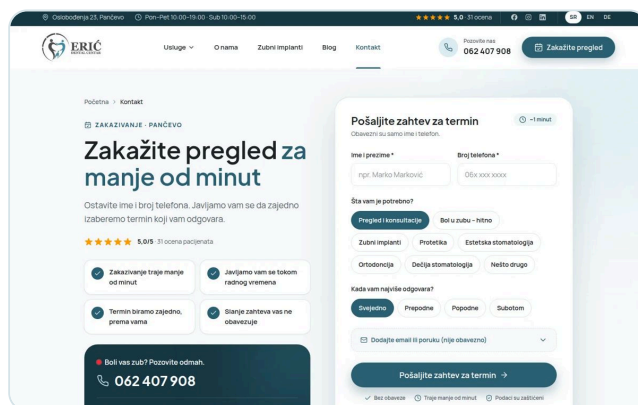

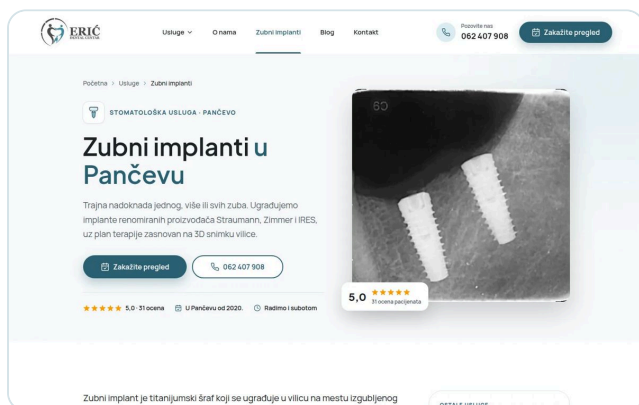

Local SEO

- Every service has its own page, written for what people actually search for: “dental implants Pančevo”, “children’s dentist Pančevo”, “wisdom tooth removal”. Each comes with FAQs and related articles.
- Structured data describes the practice as a dentist with its address, GPS coordinates, opening hours, service area (Pančevo, the South Banat District, Belgrade), all 9 services and the team.
- The site is linked to the Google Business Profile, Facebook, Instagram, LinkedIn and the doktor.rs listing, with the same name, address and phone everywhere.
- Service pages and articles are marked up as medical content, with Dr Miloš Erić as the author of the articles. For health topics, Google looks closely at who stands behind the content.
- Every page has a unique title and description of the right length, a canonical URL, breadcrumbs and a sitemap entry. Pages that should not be indexed, like the thank-you page, are excluded.

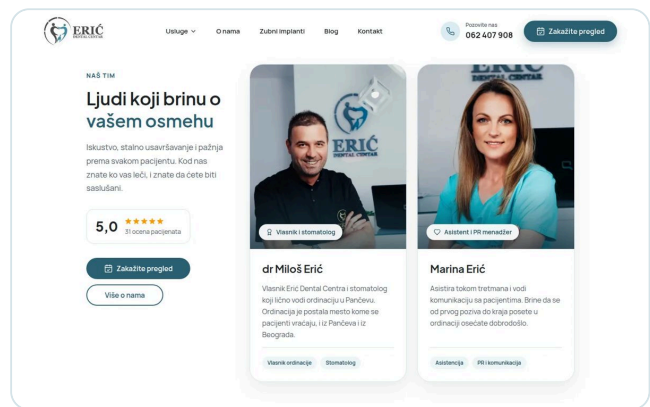

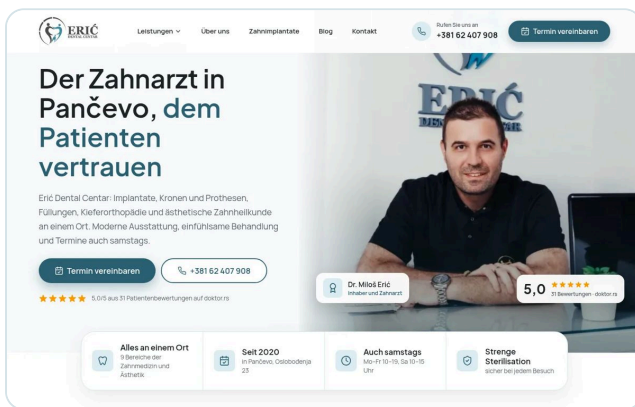

Nothing from the old search history was lost

- All services and articles kept exactly the URLs they had on WordPress, so the search history they had built up carries over.
- The nine remaining WordPress URLs (the theme’s demo doctors, author and category pages) permanently redirect (301) to the matching new pages.

The site in Serbian, English and German

- The entire site is translated into English and German: all 9 services, 4 articles, the homepage, about and contact pages, the form including its error messages, the FAQs and the privacy policy.
- Each language has URLs in that language, such as /en/dental-implants/ and /de/zahnimplantate/, so the pages can rank in English and German search.
- Through hreflang tags Google knows which page translates which, so a visitor from Germany is shown the German version, while Serbian stays the default.
- The language switcher leads to the same page in the other language, not to the homepage. Foreign visitors see the phone number in international format (+381), and patient reviews are marked as translated from Serbian.
- Structured data, titles, descriptions and dates are localised for each language. For a practice that treats patients from abroad, this is an open channel to the diaspora and international patients.

Site structure

Home, About, Contact	3 × 3 languages
Service pages	9 × 3 languages
Blog and articles	5 × 3 languages
Services, thank-you, privacy policy	3 × 3 languages
Total	60 pages

Next steps

- Collecting Google reviews regularly. The number and freshness of reviews on the Google profile weigh most in local rankings.
- New articles answering the questions patients ask, in all three languages.
- A monthly report on visits and leads, showing which services and pages bring in patients.
